Multimodal MRI Volume

Volume-level report

The lesion area is in the left frontal and parietal lobes of the brain with heterogeneous mixed signals and patchy high-signal areas in these regions. Edema is significant in the tissue surrounding the lesions, particularly in the left parietal lobe of the brain with high signals. Necrosis is apparent low-signal areas in the left parietal region of the brain, with mixed signals, characterized by low-signal patches within the high-signal regions. Ventricular compression is slight but maintains a generally acceptable shape.
